

I am currently using a Mac as my computer so its GUI is simplistic and easy to use. Apple offers icons and windows that help accessibility for users. GitHub is a more text based CLI that allows users to have more control. Both interfaces serve their variety of people groups providing resources for all. Personally I love the simplicity of my Mac. I do a lot of work in videography and I find Macs files and folders to be exactly what I need when it comes to my work. I have grown up on a Mac since I was very young and it seems like home to me. I find Github interesting and I think it serves the same purpose and a lot more as an interface. I look forward to learning something out of the normal and stepping out of my comfort zone. I find it amazing the way GitHub and my Apple desktop goes hand and hand allowing files and folders to be transferred from my local desktop to an online GitHub account. I look forward to using GitHub and I think based off of using it today ill catch on to it quickly.
